

# Perma<sup>TM</sup>

Laboratory Device for Testing the Rapid Chloride Permeability of Concrete

Four Measurement Channels

Flexible Logging Intervals

Customizable Setup

Laboratory Device for Testing the Rapid Chloride Permeability of Concrete

## Overview

Perma is a laboratory device for measuring the electrical resistance of concrete against the penetration of chloride (RCPT). This data is used to estimate the chloride penetration of concrete for predicting service life, durability-based design, and durability-based quality control, of concrete structures. Perma is electrically certified for rapid chloride penetrability tests in concrete laboratories. This device is the only RCPT device that has a CSA electrical safety certification mark for use in concrete laboratories. It is also standardized by ASTM C1202.

## Features

### Software

- Automatic temperature control system
- Accurate ( $\pm 0.1$  mA)
- Flexible logging interval time
- Free user-friendly PC software

### Hardware

- Four measurement channels
- Verification kit included
- Stand-alone operation device
- Auto-sealable cells with rubber gasket and spacer

Chloride Penetration	56-Day Rapid Chloride Permeability Charge
High	>4000
Moderate	2000-4000
Low	1000-2000
Very Low	100-1000
Negligible	<100

## Applications

- Measurement of chloride penetration resistance
- Bulk electrical conductivity of concrete
- Performance-based quality control of concrete
- Estimation of chloride migration and diffusion coefficient of concrete
- Service life design of concrete structures

## Technical Specifications

**Measurement Channels**  
4

**Range of Current Measurements**  
0 - 500 mA  $\pm$  0.1 mA

**Temperature Measurement Range**  
0 - 100°C

**Standards**  
AASHTO T277 & ASTM C1202

**Software**  
Free PC program
